ABSTRACT:

The vacuum cleaner attachment consists of a tubular connecting piece with opening(s) at its sucking-in end and is characterised in that long whirling-up elements (3) are attached by one end to the connecting piece (1) in the vicinity of the sucking-in opening(s) (4; 12), their free ends (3<a>) being soft and flexible on contact with the surfaces and objects from which the dust is to be removed, and the whirling-up elements (3) as a whole have a flexural rigidity which substantially withstands the suction air flow produced. With this attachment, the removal of dust is considerably facilitated. Surfaces filled with objects do not need to be cleared for dust removal. <IMAGE>
